

# Ghouri Iqbal Khan

Senior DevOps Engineer · Cloud FinOps & Automation Specialist

Multi-cloud infrastructure, cost governance, and self-service platform engineering across AWS, Azure & GCP.

pathaniqbalkhan54321@gmail.com

Bengaluru, India

## SKILLS

### Cloud Platforms

AWS (EC2, VPC, S3, IAM, KMS, RDS, ECS/EKS, ECR, Lambda, Route53, CloudFormation, CloudWatch, Athena, Glue, QuickSight) · Azure (VMs, VNet, NSG, Key Vault, Entra ID, Storage, Azure OpenAI, Cost Mgmt) · GCP (Compute Engine, Persistent Disks, Cloud Load Balancing)

### Cloud FinOps

Cost governance & showback, live pricing-API integration, budget/anomaly tracking, savings recommendations, chargeback design

### Compliance & Audit

ISO 27001 & RCSA control frameworks — control mapping, evidence collection, audit remediation

### Databases

PostgreSQL, ClickHouse, Redis/Valkey, MySQL — administration, performance tuning, backup/HA, and running them as the data layer behind cost-analytics and platform state

### IaC & Automation

Terraform (modules, workspaces), Ansible (playbooks, roles), GitLab CI/CD

### Orchestration

Docker, Kubernetes (Deployments, Services, HPA/VPA, rolling upgrades, multi-tenant namespace isolation), EFK (Fluentd log pipelines)

### Monitoring & Security

Prometheus, Grafana, Nagios, Zabbix, ELK · IAM/SCP/KMS, Sectona PAM, SentinelOne

### Build Tools

Maven, Gradle, Apache Ant — Spring Boot build stages inside GitLab CI

### Scripting

Python, Shell, PowerShell, SQL, basic Java

### Linux Administration

User & permission management, networking, disk/LVM management, SSH, systemd, Crontab

### AI-Assisted Engineering

Directing LLM coding agents (Claude) to architect, build & ship production systems — requirements-to-spec, generated-code/infra review, iterative delivery

## EDUCATION

### B.Tech — Electronics & Communication Engineering

Presidency University, Bengaluru  
2016 — 2020

## LANGUAGES

- English
- Hindi
- Telugu
- Kannada

## SUMMARY

Senior DevOps Engineer with 4+ years building and operating AWS & Azure infrastructure, with a growing specialization in **Cloud FinOps** — cost governance, self-service provisioning, and multi-cloud inventory platforms. Strong command of Terraform, Kubernetes (EFK/Fluentd logging), CI/CD, cloud security, patch management, and EDR (SentinelOne), backed by hands-on experience supporting ISO 27001 and RCSA audit cycles from the infrastructure side — control mapping, evidence collection, and remediation tracking. Pairs platform-level thinking with the ability to turn cost, governance, and compliance requirements directly into working systems alongside engineering teams.

## KEY PROJECTS

### FinOps Platform — FinOps, Inventory & Provisioning Infra

- FinOps tile:** owned the technical requirements and architecture for multi-cloud (AWS/Azure/GCP) cost dashboards, budget & anomaly tracking, savings recommendations, and an AI assistant for natural-language cost queries.
- Inventory tile:** specified a live, drill-down inventory across 25+ resource categories on AWS and Azure (GCP extension scoped), fed by dedicated per-service extraction pipelines so every view reflects real infrastructure, not a stale snapshot.
- Provisioning Infra tile:** designed the self-service request workflow that auto-generates Terraform (modular EC2/EBS/security-group resources) from an approved request, gated by cost approval and RBAC before anything is created in AWS.
- Defined the RBAC/permission model and full audit trail securing every module, and specified real-time AWS Pricing API integration so cost sheets never rely on stale, cached data.
- Shaped the platform's data layer: **ClickHouse** for high-volume billing/cost analytics queries, **PostgreSQL** for transactional app & audit state, and **Redis/Valkey** for session/cache workloads — balancing each store to the access pattern it actually serves.
- Built end-to-end via an **AI-assisted, agentic development workflow** — directed **Claude (Anthropic)** as a coding agent from requirements through implementation, personally reviewing and validating every generated code and infrastructure change before it shipped to production.

### FinOps Data Engineering — Multi-Cloud Billing to ClickHouse

- Engineered the billing data pipeline that feeds the FinOps tile above — normalizing raw AWS CUR, Azure FOCUS, and GCP billing exports into one unified ClickHouse warehouse that every cost dashboard, budget check, and AI query reads from.
- Built checksum/manifest-based incremental loading plus data-quality reconciliation (FX-rate normalization, tag/account-rename backfills) that corrects already-loaded historical data in place, so daily ingestion runs safely unattended without a full re-ingest.
- Automated the full cycle via a cron-scheduled, lock-protected pipeline with materialized views auto-refreshing summary tables, and tuned ClickHouse (memory caps, swap, batched mutations) for unattended production stability.
- Directed via the same **AI-assisted, agentic workflow** as the platform above — built end-to-end with **Claude (Anthropic)** as the coding agent, requirements through implementation, under my own review at every step.

## PROFESSIONAL EXPERIENCE

### Perfios Software Solutions Pvt Ltd

Sep 2022 — Present

#### Senior DevOps Engineer

- Engineered and managed AWS & Azure infrastructure across Dev/Staging/Production using Terraform-driven IaC — reusable, versioned modules with remote state (state files, locking, workspace isolation) for safe, repeatable deployments.
- Built and hardened GitLab CI/CD pipelines — Maven/Gradle/Ant build stages packaging Spring Boot applications — with environment-based deployments to both Kubernetes and monolithic VM targets, and safe rollbacks.
- Operated multi-tenant Kubernetes clusters — per-tenant namespace isolation with scoped RBAC, ResourceQuotas/LimitRanges, and NetworkPolicies preventing cross-tenant traffic, alongside Helm-based chart/release management, HPA/VPA scaling, zero-downtime rolling upgrades, and Fluentd-based log aggregation into ELK (EFK stack).
- Automated server provisioning, configuration, and patch management at scale using Ansible playbooks and roles, complemented by SentinelOne EDR for continuous endpoint threat detection and response.
- Enforced cloud security posture across every environment — IAM/SCP policy boundaries, KMS encryption, and private networking (VPC endpoints, no public exposure).
- Implemented monitoring & alerting with Prometheus, Grafana, Nagios, and Zabbix, routed to on-call teams via Slack webhook integrations.
- Built automated cloud-native workflows with EventBridge and Lambda, with SNS driving Slack/email notifications for operational events.
- Rolled out Sectona PAM org-wide, centralizing privileged access control and session auditing across cloud accounts.
- Delivered QuickSight cost dashboards spanning AWS, Azure, and GCP for cross-cloud spend visibility.
- Supported ISO 27001 audit cycles from the infrastructure side — technical evidence collection, access/security control validation, and closing findings within SLA.
- Contributed to RCSA (Risk & Control Self-Assessment) cycles, mapping infrastructure controls to risk domains and maintaining control-effectiveness evidence for cloud environments.
